

Business Requirements Document

1. Document Control

Project Name	Nota – Installment Management System
Version	v0.2
Author(s)	Doaa Alaaelden
Date	06/08/2026
Status	Approved

2. Executive Summary

We will build Nota, a tool that allows the user to manage clients, products, and installment contracts in an easy, consistent, and readable way. The system lets the user add, update, delete, and view clients, products, and contracts; search clients and products; and record payments. The user holds a balance, set at sign-up and editable/toppable-up afterward, which the system checks before allowing a new contract to be created. The balance decreases by a contract's remaining amount when the contract is created, and increases as the client makes payments. The system also provides a dashboard summarizing sales, collections, and profit.

3. Business Objectives

- Allow the user to add, update, delete, and view clients
- Allow the user to add, update, delete, and view products
- Allow the user to add, update, delete, and view contracts
- Allow the user to search for clients and products
- Allow the user to set and update their balance, and use it to gate contract creation
- Allow the user to record payments and automatically update their balance
- Allow the user to see a dashboard of overall system analysis (clients, products, contracts, sales, collections, profit)

4. Background & Problem Statement

The client had a problem managing installment sales: many clients, products, and contracts made manual handling of data, payments, and balances very difficult, with no reliable way to know whether enough capital was available before committing to a new contract. Nota gives the client a single tool to store and update clients, products, and contracts, search clients and products, record payments, track their balance automatically, and see the progress and analysis of the business in one place.

5. Scope

5.1 In Scope

- Build CRUD pages for clients, products, and contracts
- Build a search mechanism for clients and products
- Build a payments feature that records payments against a contract
- User balance set at sign-up, editable/can be topped up by the user
- Balance check that gates contract creation (contract is only created if balance is sufficient)
- Automatic balance tracking: decreases by a contract's remaining amount on creation, increases by each client payment

- Build a dashboard that displays total clients, total products, total contracts, sales, collected amount, remaining amount, installments due today, overdue installments, monthly profit, and expected amount

5.2 Out of Scope in this version

- Filtration mechanism — Note: filtration is not included in this version
- Notify the client on due date
- Allow external users to use the system
- Using AI techniques
- Online/external payment processing

6. Stakeholders

Name / Role	Responsibility
Project Manager	Who will build the system
End-User	Who will actually interact with the final product

7. Success Criteria / KPIs

- The user can perform CRUD operations on clients, products, and contracts
- The user can search for clients and products
- The system correctly blocks contract creation when the user's balance is insufficient
- The user can record payments and see their balance update automatically
- The user can see the dashboard of the system analysis
- Reduce the time spent on manual data manipulation
- Overall system usability increases

8. Timeline / High-Level Milestones

Milestone	Target Date
Discovery & Requirements Gathering	Finished
BRD Approval (Sign-off)	06/08/2026
PRD Creation and Approval	06-08/08/2026
Design & Prototyping	09/08/2026
Implementation	10-24/08/2026
Testing	25-28/08/2026
Deployment	30/08/2026
First Launch	31/08/2026

9. Approval

Name	Role	Signature	Date
