

Project Brief

Nota

1. Document Control

Project Name	Nota – Installment Management System
Version	v1.0
Author(s)	Doaa Alaaelden
Date	06/08/2026
Status	Draft

2. Purpose

Nota is an installment management system that allows a business owner to manage clients, products, and installment contracts in one place, track payments and outstanding balances, and monitor overall sales and profit through a live dashboard.

3. Problem Statement

Business owners who sell on installment plans currently track clients, products, contracts, and payments manually. This makes it difficult to know who owes what, which installments are due or overdue, and how the business is performing overall. Nota replaces this manual tracking with a single, consistent system.

4. Proposed Solution

Nota will let the user manage three core entities — clients, products, and contracts — with full add, update, delete, and view capability. The user (business owner) holds a balance, set at sign-up and editable/toppable-up afterward, which acts as the capital available to fund contracts. Before a new contract is created, the system checks whether the user's balance is sufficient; if so, the contract is created and the balance decreases by that contract's remaining (unpaid) amount. As the client pays installments, each payment increases the user's balance. The system also provides search for clients and products, and a dashboard summarizing the health of the business.

5. Key Features

- Add, update, delete, and view clients
- Add, update, delete, and view products
- Add, update, delete, and view contracts
- Search for clients and products
- Record payments against a contract
- User balance: set at sign-up, editable/can be topped up by the user at any time
- Balance check gates contract creation — a contract can only be created if the user's balance is sufficient
- Balance decreases by a contract's remaining (unpaid) amount when the contract is created, and increases by each payment the client makes
- Edit clients, products, contracts, and payments
- Dashboard showing: total clients, total products, total contracts, total sales, collected amount, remaining amount, installments due today, overdue installments, monthly profit, and expected amount

6. Out of Scope

- Filtration mechanism — Note: filtration is not included in this version of Nota
- Automated due-date notifications to clients
- External/client-facing access to the system
- Use of AI techniques
- Online/external payment processing

7. Target User

The primary user is the business owner or an internal staff member who manages clients, products, contracts, and installment payments.

8. Success Criteria

- The user can fully manage clients, products, and contracts (add, update, delete, view)
- The user can record payments and see the contract balance update automatically
- The user can view an accurate, up-to-date dashboard of clients, products, contracts, sales, collections, remaining amounts, due/overdue installments, monthly profit, and expected amount
- Manual data tracking effort is reduced
